

Soil Health

Soil health is critical to fertility and resilience to weather

Water

Drought, flood and runoff above and below ground and transpiration

Health

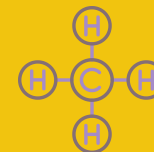

Soil, plant and animal health all impact human health

Security

Distance to markets and reliance on third party inputs

Emissions

Jobs

Farming is one of the most important jobs

Welfare

The conditions animals are kept in influence many factors

Prices

People need to be able to afford to eat

Biodiversity

Biodiversity loss is one of the greatest threats to mankind

The main emissions from agriculture are Ammonia and Nitrogen Dioxide from fertiliser use, manure spreading and urination of livestock and Methane from passing of gas by livestock.

High levels of Nitrogen cause elevated air concentrations and are deposited on plants which unbalance the natural cycles
